AEROSPACE & DEFENSE

Earth Observation Solar System Exploration

The mapping of planetary surfaces is a fundamental tool for understanding their formation, evolution and to exploit manned or robotic exploration missions.

Similarly, Earth Observation is fundamental to collect information about weather, geology, geochemistry, and to develop downstream applications, like urban planning, precision agriculture, forecasting, land-use management, disaster recovery.

At EIE GROUP we are developing innovative HyperSpectral Stereo Cameras for the generation of 4D Datacubes (Hyperspectral Digital Elevation Models - HyperDEM).
